Bugzilla link: 1517229	Red Hat JIRA:
Pull request:	
Description	
Cloned from https://bugzilla.redhat.com/show_bug.cgi?id=1517229	
Description of problem:	
While creating new config file Infrastructure --> Virt-who Configurations --> Create Config there is option "Interval" to mention under Schedule	
Each time you create a new config file and if changed this Interval option then it changes the virt-who_interval in /etc/sysconfig file.	
Eg. created first esx config file and set Interval = 2 hours. Then created second rhvm config file and set Interval = 1 hour	
Running # hammer virt-who-config deploy --id 2 on satellite server will override /etc/sysconfig/virt-who file and set virt-who interval as 3600 which was earlier 7200.	

So here should be a naming change for Schedule as "Global schedule" file or something more meaningful and a message should be displayed in information box as it will affect your global settings and this is not the local setting for that config file.	
Version-Release number of selected component (if applicable):	
satellite 6.3.0 25.0 virt-who-0.19-6.el7_4.noarch foreman-1.15.6.9-1.el7sat.noarch

- translation missing: en.field_release deleted (320)

- Pull request deleted (https://github.com/theforeman/foreman_virt_who_configure/pull/76)

actually for help improvement we'll use separate ticket, this one is to solve the separate configuration once virt-who allows that
