

Installer - Bug #2346

Installer does not generate valid apache configuration

Description	
<p>At least under Ubuntu, the installer is not generating valid apache configurations for the foreman side of things, and this causes an SSL error (which I reported in IRC).</p> <p>Basically if you specify a vhost while NOT specifying a NameVirtualHost setting, apache freaks out.</p> <p>The fix for this is simple in Ubuntu. Add the following to ports.conf:</p> <pre><IfModule mod_ssl.c> # If you add NameVirtualHost *:443 here, you will also have to change # the VirtualHost statement in /etc/apache2/sites-available/default-ssl # to <VirtualHost *:443> # Server Name Indication for SSL named virtual hosts is currently not # supported by MSIE on Windows XP. Listen 443 NameVirtualHost *:443 </IfModule></pre> <p>Then you need to modify the foreman installer to use then: <VirtualHost *:443> instead of the server IP... or you could use the server IP, but I think it should be safe to not do so.</p>	

History

#1 - 05/10/2013 09:25 AM - Dominic Cleal

- Status changed from New to Closed
- Target version set to 1.2.0
- % Done changed from 0 to 100

Thanks for the report, I think this has now been resolved by <https://github.com/foreman/puppet-foreman/commit/2a756241d52>.

#2 - 07/10/2018 02:43 PM - Greg Sutcliffe

- Target version deleted (1.2.0)
