Description

Hello team,
We are on a verge of upgrading our foreman setup from 1.10.3 to 1.20 and would like to keep the database on a different setup.
Didn't find anything specific with Postgres version to be chosen as a dependency on any of the docs, so is it fine if we go ahead with
Postgres version 11 with foreman 1.20.
Also, has anyone done a full upgrade from 1.10 to 1.20?

Our current setup
1. foreman server - 1.10.3 version - runs on ubuntu14.04

Our plans for an upgrade.
1. Install foreman server 1.20 on a Ubuntu 18.04 machine.
2. Do a pgdump of the current setup (1.10) and restore the same on (1.20)

Any suggestion is really appreciated.

Hello,

please use our community at https://community.theforeman.org/ for discussion.

We haven't heard about any issues with PGv11 so far. Upgrade across multiple versions is not tested, we recommend to upgrade one by one in case
this fails for whatever reason.
