| Description hi, i am using the foreman smartproxy on its own. i know that foreman is able to force record creation/overwrite, if for example a PTR record for an ip is still present. i guess foreman is setting some attribute in the post body for this, could you please let me know the name and value of the parameter to force record creation? | |

I think Foreman deletes it because we don't have code to force it. From a REST perspective you would expect PUT /:value/:type but there's no implementation for that. Would be a good enhancement though.

okay so the solution right now would be to make a POST call, if it fails with a duplicate resource error (or whatever it is throwing), make a DELETE call, and then retry the POST again.

that would also work for me, thx
