Description

I am very new to foreman and I want to install it in an offline environment.

I thought the docker-compose file found in the repository could be a great solution for that (
https://github.com/theforeman/foreman/blob/develop/docker-compose.yml)

First I tried to use it an online environment but I get many errors which I can even start to resolve.

1) Did anyone know how to use the docker-compose file to setup foreman ?

2) Is there a guide for setting foreman in an offline environment ? (Also updating it and installing plugins)

- Priority changed from Immediate to Low

this is not a bug and it's not an immediate priority - this is a question that should probably be asked to community support or raised as a roadmap / feature request

#2 - 07/05/2022 12:00 PM - Ewoud Kohl van Wijngaarden

On https://community.theforeman.org/ there are some threads about this. I don't think it's within the installer's scope to use this.

> 2) Is there a guide for setting foreman in an offline environment ? (Also updating it and installing plugins)

Not really, but you mostly need to mirror the yum repositories and consume those. Then the installer should work.
