

Installer - Bug #36532

Enabling an optional content type does not restart Puma

Description	
Ohai,	
when running the installer with <code>--foreman-proxy-content-enable-ostree=true</code> to enable the (optional) OSTree support, the bits get installed and configured correctly on the Proxy side, but Puma/Foreman/Rails is not restarted.	
As Katello's RepositoryTypeManager (https://github.com/Katello/katello/blob/master/app/services/katello/repository_type_manager.rb) does not check for available Pulp capabilities on every request, this means that the APIDoc we serve remains stale and does not mention any ostree-specific parameters, thus breaking API clients which adhere to the apidoc as the source of truth.
