Description	
In the normal installer we run katello-certs-check (in hooks/pre_commit/20-certs_update.rb) but don't do this in foreman-proxy-certs-generate so it's possible to create an invalid archive. Then when it's transferred to the target system it finally runs and may show an error. It's best to warn the user as soon as possible so running katello-certs-check before generation is a good thing.

I realized I also created [#36843](#) for this and ended up implementing more on that issue.
